

QC-SOP-026 — Worklists, search, dashboards and notifications

Revision D0.2 | DRAFT FOR REVIEW | Revised 2026-10-04

Effective date: not recorded. Approval/signature: not recorded. This draft does not authorize testing, release, production changes or UAT acceptance.

1. Purpose and scope

Use read models and in-app notifications to find work without treating them as controlled decisions or complete evidence.

Implementation: SOURCE-ALIGNED DRAFT

2. Responsibilities and review

Responsible specialists: Authorized system user; Work owner; Support

Review: Authorized system user; Work owner; Support

Approval: Authorized QMS / Document Control approver under the approved document policy; not yet established for this draft

3. Before you start

- The user is authenticated and has source read permissions.
- The route and selected filters are known.
- The operator understands the bounded-page and source-status display.

4. Procedure

1. Open the appropriate dashboard, /work or /search surface and review scope, period and source status before acting on a count.
2. Search uses per-source permissions and supported scope. Keep denied sources distinct from failures; do not infer inaccessible record existence from a missing result.
3. Read the exact total and page boundary. A sampled or fifty-row page is not the whole register; continue through supported pagination when needed.
4. Open the underlying controlled record before performing work. A summary or notification may be older than the record version.
5. Use in-app notifications for personal workflow awareness. The implemented final-approval projections cover inspection/laboratory FINAL_APPROVE with APPROVED; Supervisor stage1 is intentionally silent.
6. Mark only your own notification read through the supported action. Read state is not acknowledgment of a controlled QC decision.
7. Investigate failed source reads through support with a sanitized correlation identifier. Keep available independent sections usable and do not replace unavailable totals with zero.
8. Reconcile overdue or missing work against the source record and owner. Provider email/SMS delivery and worker receipt require separate evidence and are not established by these pages.

5. Decisions, errors and stop conditions

- If a source is unavailable, do not conclude the workload is empty.

- A notification delivered in-app does not prove an external provider or operator alert received it.

6. Records and handoff

- Source record handoff
- Filter/page context where relevant
- Notification read state
- Sanitized support incident

Before handoff, reopen the saved record where the application supports it and compare the result with the source. Retain an unresolved outcome as unresolved; do not infer approval from a name, signature image, task completion or test result.

7. Sources and related documents

- src/modules/dashboard
- src/modules/tasks
- src/shared/routing/routes.ts

Related work instructions: QC-WI-044

Repository sources are bound to HEAD 435f9f704049dee4916223b24b96866d7fa9af2e. Resolve source IDs, file hashes, external editions and form originals in References (source metadata is inside Authoring_Sources.zip).

8. Required decisions before approval

- DEC-022 — Worker, telemetry and alerts

Document Control records real reviewer outcomes and actual approval/effectivity only after the controlled process. Completed proposals for these decisions are provided in References/Policy_and_Method_Decision_Book.pdf. Required source evidence and owner adoption remain explicitly recorded there.

9. Current route references

- /dashboard
- /work
- /search
- /notifications

Route placeholders identify existing records. Route coverage is documentation mapping, not proof that every role/state was accepted in a browser. Exact extracted field and permission strings are in References/route-coverage.pdf and References/source-contract-register.pdf.

10. Detailed operating policy and review checks

These are D0.2 proposed operating controls for adoption. Official company records remain valid physical source records; this revision does not retrospectively change their outcomes. Use the operational record named below to capture execution and exceptions.

DEC-022 — Outbox worker and operator alert protocol

Define the deployed worker, queue, claim/lease, retry/backoff, terminal-failure handling, scheduler and heartbeat. Record exporter destination, redaction and authorized alert receivers. Derive alert thresholds from approved service objectives and measured queue behavior. Under separate test authorization, enqueue a non-sensitive test event, track claim and attempt, obtain provider receipt and receiver acknowledgment, then prove deduplication/retry behavior.

Decision and exception check: A missing heartbeat, growing oldest-event age or terminal failure creates an incident under the approved threshold. A zero queue or no-op exporter is not proof of delivery. Retain raw timestamps and provider IDs; operator acknowledgment records who acted and when. No live message is sent by this document package.

Record: QC-REC-015 worker, telemetry and alert exercise; QC-WI-064.

Revision record

D0.2, 2026-10-04: expanded execution, exception and handoff controls; incorporated owner-confirmed official physical forms and completed technical decision proposals. Previous D0.1 sources are retained in History/D0.1 within Authoring_Sources.zip. Review and approval remain unrecorded.
